This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ilgand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, anti-anemic, anti-anemic, anti-anemic, anti-architic, anti-irral, immunomedulatory, dermatological, immunosuppressive, thyromimetic, anti-arteriosclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent diseases associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, remunatoid arthritis, graft versus host disease, Sjorgen's syndrome, pernicious or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autolumune hemolytic anemia, sterility, mysathenia gravis, multiple sclerosis, Basedow's disease, thromboodpara insulin and anomaly disease. dependent diabetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectively induce it in abnormal cells. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mind the native ligand, do not induce liver disease, and have reduced risk of a human anti-nurine antibody response. This sequence represents which is described in the method of the invention. New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems Tamaki I, Takahashi T; Nakahara K, 2; Page 180-182; 263pp; English. This invention describes a novel humanized anti-Fas antibody-like molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas ligand system, by binding to Fas on the cell surface, and prevents apoptosis in cells with a normal system, by inhibiting binding between comportations in cells with a normal system, by inhibiting binding between the products of the invention have anti-inflammatory, anti-anemic, anti-allergic, anti-arthritic, antiviral, antiranemic, nephrotropic, anti-allergic, anti-arthritic, antiviral, antirheumatic, nephrotropic, antimerallity, neuroprotective, antiarteriosclerotic, cardiant and hepatropic activity. (I) induce antiarteriosclerotic, cardiant and hepatropic activity. (I) induce completion of ligand binding. (I) are used to treat and/or prevent disease associated with the Fas/Fas ligand system, especially systemic unbibition of ligand binding. (I) are used to treat and/or prevent disease, Sjorgen's syndrome, pernicious or hypoplastic complay host disease, soleroderma, Goodpasture syndrome, Composition of disease, slorgen's syndrome, pernicious or hypoplastic anemia, attentity, myasthenia gravis, conditionyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral (B, C or D) or alcoholic), and transplant rejection. (I) selectively inhibit apoptosis in normal cells but selectives; so can be evaluated in colls. They bind to both human and murine Fas, so can be evaluated in murine disease models. (I) act on the active site of Fas, i.e. they mimic the native ligand, do not induce liver disease, and have reduced risk of inducing a human anti-murine antibody response. This sequence represents con humanised anti-Fas antibody heavy chain construct designated Heu 2 was a humanised anti-Fas antibody beavy chain construct designated Heu 2 was an expectable of the nethod of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This is the amino acid sequence of the HV type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. It includes humanising R4d6 and A76T amino acid substitutions that are are conserved in the human IGG heavy chain. Host Escherichia coli pathoHV3 SANK 70298 harbors plasmid pgHPDHV3 carrying a fusion fragment of the humanised HV type HFE7A heavy chain and DNA cancoding human IGG1 constant region (see AAAVO080), and is deposited as FERM BP-6273 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised versions of HFE7A (see AAW8301-37), like native HFE7A, are capable of inducing apoptosis in abnormal cells expressing Fas, and of antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to treat such diseases, including autoimmune disease (e.g. systemic lupus erythematosus, Hashimoto's disease, graft versus host disease, solorens anomalia, sterility, myasthenia gravis, multiple scl rosis, Basedow's disease, thermatoid arthritis, autoimmune haemolytic anaemia, sterility, myasthenia gravis, multiple scl rosis, Basedow's disease, thermatoid arthritis, myocarditis, cardiomyopathy, glomerulain nephritis, hypoplastic myocarditis, cardiomyopathy, glomerulain repection (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      61 GQGLEWMGEIDPSDSYTNYNQKFKGKATLTVDTSTSTAYMELSSLRSEDTAVYYCARNRD 120

                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HFETA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HFETA, via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autoimmune diseases, allergy, atopy, arteriosclerosis, myocarditis, cardiomyopathy, allowerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS and organ graft rejection. Sequences ABB14775-B14776 and AAB14779 represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                     Anti-Fas antibody, monoclonal antibody HFB7A; FERM-BP-5828; murine; humanised antibody; complementarity determining region; CDR; human Fas; Fas Iigand, apoptosis modulator; programmed cell death; autoimmune disease; allergy; atopy; arteriosclerosis; myocarditis; cardiomyopathy; glomerulonephritis; aplastic anaemia; panmyelophthisis; hepatitis; AIDS; graft rejection; heavy chain.

capoptosis in cells with a normal system, by inhibiting binding between Fas and its ligand. The products of the invention have anti-inflammatory, antidiabetic, anti-allergic, anti-arthritic, antivaral, immunomodulatory, dermatological, immunosuppressive, thyromimetic, antintreniscientic, cardiant and hepatropic activity. (I) induce antiarterisoclerotic, cardiant and hepatropic activity. (I) induce antiarterisoclerotic, cardiant and hepatropic activity. (I) induce apoptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent capptosis by binding to cell surface Fas or inhibit it by competitive inhibition of ligand binding. (I) are used to treat and/or prevent capptosis assesses associated with the Fas/Fas ligand system, especially systemic lupus erythematosus, Hashimoto disease, rheumatoid arthritis; graft versus host disease, Slorgen's syndrome, permittions or hypoplastic anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's disease, autoimmune hemolytic anemia, sterility, myasthenia gravis, cardiomyopathy, glomerulonephritis, hepatis; (fulminant, chronic, viral cappetes mellitus, allergy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, hepatis; (fulminant, chronic, viral cardiomyopathy, glomerulonephritis, hepatis; (fulminant, chronic, viral calls. They bind to both human and murine Fas, so can be evaluated in mumulised anti-Fas antibody HEP7A designed heavy chain which is used in the method described in the invention.

This is the amino acid sequence of the VD type humanised heavy chain of murine anti-human Fas monoclonal antibody HFE7A. E. colipgHSL7A62 SARK 73397 harbors plasmid pgHSL7A62 carrying a fusion fragment of the humanised VD type HFE7A heavy chain and DNA encoding human IgGl constant region (see AAV70079), and is deposited as FERM BP-6074 (claimed). The invention provides methods for producing humanised antibodies by culturing host cells. Humanised of inducing apoptosis in abnormal cells expressing Fas, and of inducing apoptosis in abnormal cells expressing Fas, and of inhibiting Fas-induced apoptosis in normal cells. The humanised antibodies are used to evaluate, in animal models, treatments of diseases that involve Fas/Fas ligand interactions, and also to antibodies and proteins bind conserved epitope of Fas antigen - 1 to evaluate drugs in animal models and to treat Fas-associated masses e.g. autoimmune disease, allergy, atopy, arteriosclerosis, Claim 22; Page 212-213; 292pp; English. used to evaluate drugs in animal m diseases e.g. autoimmune disease, myocarditis, hepatitis and AIDS WPI; 1998-543440/47. N-PSDB; AAV70079. New

AAW83036 standard; Protein; 470

The invention relates to compositions for the prevention or treatment or diseases caused by an abnormality in the Fas/Fas ligand system containing an anti-Fas antibody as the active component. The anti-Fas antibody is either the murine anti-human Fas monoclonal antibody HEFTA, or a humanised version of HFETA containing identical CDRs (complementarity determining regions) to antibody HEFTA. Via its interaction with Fas, the antibody of the invention acts as a modulator of apoptosis. The compositions of the invention may therefore be used in the treatment or prevention of conditions such as autofinance diseases, allery, atopy, arteriosclerosis, myocarditis, cardiomyopathy, glomerulonephritis, aplastic anaemia (panmyelophthisis), hepatitis, AIDS represent the heavy chains (or fragments thereof) of various humanised HFETA-derived anti-Fas antibodies.
                                                                                                                                                                                                                                for the diseases caused by an abnormality
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300

Nakahara K, Tamaki I, Takahashi T; Serizawa N, Haruyama H,

WPI; 2000-258930/23. N-PSDB; AAA11597 New humanized anti-Fas antibody, useful for treating or preventing e.g. inflammatory or autoimmune disease, induces apoptosis selectively in cells with abnormal Fas-Fas ligand systems

Example reference 15; Page 134-136; 263pp; English.

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas

ligand system, by binding to Fas on the cell surface, and prevents

apoptosis in cells with a normal system, by inhibiting binding between

Fas and its ligand. The products of the invention have anti-inflammatory,

anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,

immunomodulatory, dermatological, immunosuppressive, thyromimetic,

antiarteriosolerotic, cardiant and hepatropic activity. (I) induce

antiarteriosolerotic, cardiant and hepatropic activity (I) induce

thibitition of ligand binding (I) are used to treat and/or prevent

clupus extythematosus, Hashimuco disease, rheumatoid arthritis, graft

versus host disease, Sjorgen's syndrome, pernicious or hypoplastic

anemia, Addison's disease, scleroderma, Goodpasture syndrome, Crohn's

clasease, autoimmune hemolytic anemia, sterility, myasthenia gravis,

multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin

dependent diabetes mellitus, allergy, arteriosolerosis, myocarditis,

cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral

(B, C or D) or alcoholic), and transplant rejectively induce it in abnormal

cells. They bind to both human and murine Fas, so can be evaluated in

murine disease models: (I) act on the active site of Fas, i.e. they mimic

the native ligand, do not induce liver disease, and have reduced risk of

a humanised anti-maine antibody response. This sequence represents

a humanised anti-maine antibody response. This sequence represents

the partorice and pres

AA; 470 Sequence

the method described in the invention.

This invention describes a novel humanized anti-Fas antibody-like

molecule (I) that, induces apoptosis in cells with an abnormal Fas/Fas
ligand system, by binding to Fas on the cell surface, and prevents
cappotosis in cells with a normal system, by inhibiting binding between
Fas and its ligand. The products of the invention have anti-inflammatory,
anti-anemic, antidiabetic, anti-allergic, anti-arthritic, antiviral,
immunomodulatory, dermatological, immunosuppressive, thyronimetic,
antirheumatic, nephrotropic, antimifertility, neuroprotective,
antiarteriosclerotic, cardiant and hepatropic activity. (I) induce
antiarteriosclerotic, cardiant and hepatropic activity (I) induce
continues by binding to cell surface Fas or inhibit it by competitive
continues by the man to cell surface Fas or inhibit it by competitive
continues binding. (I) are used to treat and/or prevent
continues associated with the Fas/Fas ligand system, especially systemic
colliseases associated with the Fas/Fas ligand system, especially systemic
collisease, soloroderma, Goodpasture syndrome, Crohn's
disease, autoimmune hemolytic anemia, sterility, myasthenia gravis,
multiple sclerosis, Basedow's disease, thrombopenia purpura, insulin
cells and inhebetes mellitus, allergy, arteriosclerosis, myocarditis,
cardiomyopathy, glomerulonephritis, hepatitis (fulminant, chronic, viral
cells. They bind to both human and murine Fas, so can be evaluated in
cells. They bind to both human and murine Fas, so can be evaluated in
cells. They bind to both human and murine Fas, so can be evaluated in
cells. They bind to both human and murine Fas, so can be evaluated in
cells. They bind to both human and murine Fas, so can be evaluated in
cells and humanised anti-murine antibody response. This sequence represents
con human anti-musine antibody response. This sequence represents
con human anti-musine antibody response. This sequence represents
con human anti-musine antibody response.
                                                                                                                                                                humanized anti-Fas antibody, useful for treating or preventing e.g. Lammatory or autoinmune disease, induces apoptosis selectively in

The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM52154-268 and encoded by ABA02682-ABA02128. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                         Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;
cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.

```
The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytocoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                          Humanised monoclonal antibody; polymorphic epithelial mucin; PEMI;
cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.

1;
having specificity for polymorphic epithelial mucin (PEM) or its antigen binding fragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;

                                                                                                                                  The invention relates to a compound which comprises a target cell-specific portion, comprising an humanised monoclonal antibody, having specificity for polymorphic epithelial mucin (PEM) or its antigen having ragment and a cytotoxic portion having endonucleolytic activity, exemplified by AAM52154-AAM52168 and encoded by ABA02682-ABA02728. The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Humanised monoclonal antibody; polymorphic epithelial mucin; PEM1;
cytotoxic; endonuclease; DNase I; human; cytostatic; cancer; apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                300

The compound has cytostatic activity useful for treating cancer and acting as a potential inducer of apoptosis.
